

Push Button Mechanism - Brown Finish

£10.25

Excl. Tax: £8.54

Product Images

Short Description

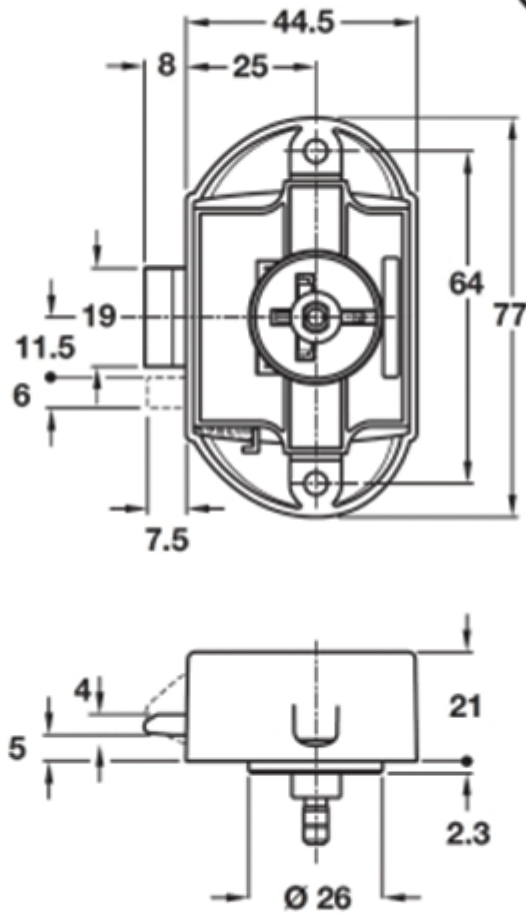

A push button mechanism with a plastic body and metal internal parts. Supplied in a brown or nickel finish.

The mechanism is secured to the rear of the door panel, the threaded male spindle passing through the appropriate through hole in the panel. The mechanism is fixed with 2x 3.5mm (No.6) countersunk screws which can be purchase seperately from the related product section below.

Suitable for use with a portion of our range of push button knob and ferrules (253 / 345* and 44*). Please see related products for compatible knob and ferrules. Once used with a knob and ferrule, the knob is pushed to engage and disengage the latch. When locked, the knob is designed to sit flush with the panel surface, making this the ideal solution for environments where nothing can protrude from the joinery surface.
